SOR® Pressure, Vacuum and Temperature Switches

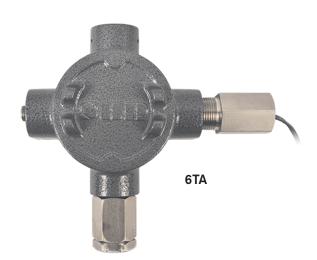

are qualified by a combination of testing and analysis per IEEE-323-1974 & 1983 and IEEE-344-1975 & 1987. See SOR Test Report 9058-102 and other applicable reports on page four for qualification testing and explanations. (Note: for nuclear qualified differential pressure switches, see SOR catalog 1291.)

Qualification testing included

- Qualification | Thermal Aging
 - Irradiation
 - Mechanical/Electrical Cycling
 - Sine Beat
 - Random Multifrequency
 - LOCA
 - HELB

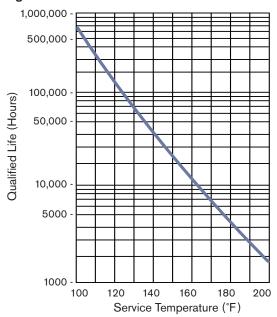

SOR maintains a quality system dedicated to compliance with the applicable elements of 10CFR50, Appendix B, ANSI N45.2 and NQA-1, including the reporting requirements of 10CFR21. The products in this catalog are manufactured under this dedicated system which is audited by the Nuclear Procurement Issues Committee (NUPIC), Nuclear Industry Assessment Committee (NIAC) and Canadian TSSA N285.0.

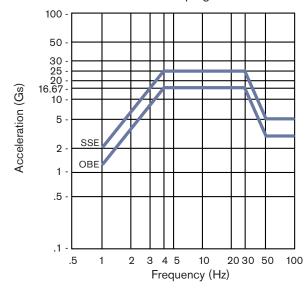

Figure 1: AGING

This graph is based on the Arrhenius equation and may be used as a general guideline in determining the qualified life if the service temperature is greater than or less than 120°F.

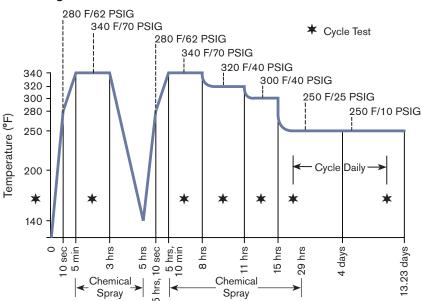

Figure 2: SEISMIC

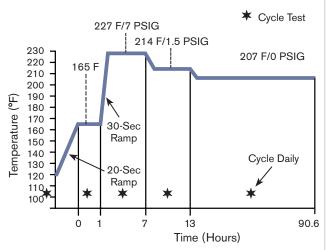

This is the RRS (Required Response Spectrum) at 1% damping to which all switches were seismically tested. All TRS (Test Response Spectrum) plots are contained in test report 9058-102. Seismic damping analysis to 0.5%, 2%, 3%, 4%, and 5% are also available upon request.

Figure 3: LOCA

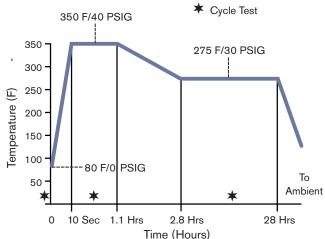

This graph shows the combined environmental conditions to which certain switches were subjected at end-of-life conditions to simulate a LOCA (Loss Of Coolant Accident). The two thermodynamic transients were generated by injecting superheated steam into the autoclave in a controlled manner. The chemical spray consisted of 0.28 molar boric acid and 0.064 molar sodium thiosulfate buffered to pH 10.5 with sodium hydroxide.

Figure 4: HELB 1

This graph shows the combined environmental conditions to which certain switches were subjected at end-of-life conditions to simulate a HELB (High Energy Line Break). The HELB 1 profile shown here was generated by injecting superheated steam into the autoclave in a controlled manner.

Figure 5: HELB 2

This graph shows the combined environmental conditions to which certain switches were subjected at end-of-life conditions to simulate a second more severe HELB (High Energy Line Break). The HELB 2 profile shown here was generated by injecting superheated steam into the autoclave in a controlled manner.

Test Program Explanation

- Thermal Aging to simulate a 20-year life at a service temperature of 120°F (see Figure 1).
 Switches were subjected to accelerated thermal aging according to the Arrhenius model and based on the lowest activation energy of all of the safety related, non-metallic materials of construction.
- Irradiation to levels as high as 200 megarads. Switches were subjected to various amounts of gamma irradiation (see test report) to simulate that amount of radiation the switch might be exposed to during its' qualified life, plus the amount of radiation it might see during an accident plus margin.
- Mechanical/Electrical Cycling to 30,000 cycles at full-scale pressure/temperature and rated electrical load. Pressure and vacuum switches were cycled either pneumatically or hydraulically from the low end to the high end

- of the adjustable range. Temperature switch sensors were thermally cycled from 20°F below set point to 20°F above set point. All cycling was conducted with full rated voltage and current applied to the switch contacts.
- Sine Beat testing at 1-50 Hz, 4.5g on line-mount temperature switches. This test was performed to age the switch and determine its response to these conditions. Only the direct mount temperature switch was chosen for this test as it is the only switch that may be line mounted.
- Random Multifrequency testing including five OBEs (Operating Basis Earthquake) and one SSE (safe shutdown earthquake) in each of four orientations (see Figure 2). This test was performed to age the switch and determine its' response to these conditions.

Test Program Explanation

- LOCA (Loss Of Coolant Accident) testing on selected models (see Figure 3). This test simulated LOCA conditions and established the switch's response/condition before during and after the test.
- HELB (High Energy Line Break) testing to two different profiles on selected models (see Figures 4 and 5). This test simulated two different HELB conditions and established the switch's response/condition before during and after the test.

The above testing brought the switches to end-of-life conditions as required by the IEEE standards and then subjected them to accident conditions. Please note that none of the qualification levels were established based on a specific application. Rather, they were chosen generically with the intent to be suitable for the majority of possible applications in nuclear power stations. It is the responsibility of the end user to establish if the qualification levels are suitable for the intended use.

Specifications

Repeatability The ability of a pressure/temperature switch to successively operate at a set point that is approached from a starting point in the same direction, and returns to the starting point over three consecutive cycles, to establish a profile. The closeness of the measured set point values is normally expressed as a percentage of span. Repeatability on SOR qualified switches will be +/-1% of span per ISA/ANSI S51.1.

Drift Maximum Annual Drift for all qualified models (except #9 & #29 pistons with U8 diaphragm) is 2.5% of span. The Maximum Annual Drift for #9 & #29 pistons with U8 diaphragms is 4.0% of span.

Temperature Influence Formulas for Pressure and Vacuum Switches

The formulas given below represent a general guideline for the expected influence of temperatures on the set points of the pressure and vacuum switches in this catalog.

Housing | Sealed -
$$\triangle$$
SP = [0.027 (psi/°F) - (SP x 0.0003 / °F)] x (Tf - Ti) | Vented - \triangle SP = - (SP x 0.0003 / °F) x (Tf - Ti)

Where: $\triangle SP = The change in the set point in (psi) from the intial value.$ <math>SP = The initial set point in (psi). TI = The initial ambient temperature in °FTf = The final ambient temperature in °F

Test Reports

for SOR Pressure, Vacuum and Temperature Switches

	Qualification Test Report. DC rating on "W" switch element.	9058-110	#4 piston with vacuum protection plate.
	"U1" diaphragm option for improved long-term drift and dead band. Affects qualification levels.		Switch without "JJ" conduit seal. Affects qualification levels. Contact SOR.
	Contact SOR.	8923-340	N6 housing modifications.
9058-106	Over temperature test for direct- mount temperature switches.	8923-343	Direct-mount temperature switch with 3-inch sensing bulb.
9058-107	Temperature switch with 25' capillary.	8923-347	Direct-mount temperature switch with conduit in top hub of TA housing.
9058-108	#9 piston with 30mPa overrange pressure.	8923-437	· ·
*Contact SOF	R for additional modifications and test reports.		Moner wetted parts.

Model Number System

12N6-B45-U8-C2A-JJTTNQ

Piston Housing Switching Range Diaphragm Pressure Port Accessories
(Designator 1) (Designator 2) Element Spring (Designator 5) (Designator 6) (Designator 7)
(Designator 3) (Designator 4)

To specify a

Pressure Switch, begin with Step 1a. Vacuum Switch, begin with Step 1b.

Temperature Switch, begin with Step 1c.

Use the sample model number above each table to position selected designators within the model number.

Step 1a: Pressure Switch

12N6-B45-U8-C2A-JJTTNQ

Place designators in positions 1 and 4.

Piston	Spring	Adjusta	ble Range	Overr	ange*
(Designator 1)	(Designator 4)	psi	bar [mbar]	psi	bar
12	4	0.5 to 6.0	[35 to 415]		
12	5	0.75 to 12	[50 to 830]	200	14
12	45	1 to 16	[70 to 1100]		
4	4	2 to 25	0.14 to 1.7		
4	5	3 to 50	0.2 to 3.5	750	50
4	45	4 to 75	0.3 to 5		
6	2	7 to 30	0.5 to 2		
6	3	12 to 100	0.8 to 7		
6	5	20 to 180	1.4 to 12		
6	45	25 to 275	1.7 to 19	1500	100
5	3	25 to 240	1.7 to 16		
5	5	35 to 375	2.4 to 26		
5	45	45 to 550	3.1 to 38		
29	45	150 to 1350	10 to 93		
9	4	100 to 500	7 to 35	2500	170
9	5	200 to 1000	14 to 70	2300	170
9	45	200 to 1750	14 to 120		

^{*}The maximum input pressure/temperature that can be continuously applied to the switch without causing a permanent change of set point, leakage or material failure.

Step 1b: Vacuum Switch

Place designators in positions 1 and 4.

54N6-B118-M9-C2A-JJTTNQ

Piston (Designator 1)	Spring		able Range 0 - Pressure)	Overrange		
	(Designator 4)	in. Hg	mbar	psi	bar	
54	118	30 - 0 - 1	1000 - 0 - 35	750	50	

Step 1c: Temperature Switch

Place designators in positions 1 and 4.

201N6-B125-U9-C7A-JJTTNQ

Probe	Range	Mounting	•	Capillary Length Adjustable Range		e Range Overrange Temperature		Max Process Pressure		
(Designator 1)	(Designator 4)	Туре	ft.	m	°F	°C	°F	°C	psi	bar
201	125	Direct	-	-						
203	125	Remote	6	1.8						
205	125	Remote	10	3.0	40 to 225 5 to 107	360	182			
207	125	Remote	15	4.5						
209	125	Remote	20	6.0					2300	158
201	115	Direct	-	-					2300	100
203	115	Remote	6	1.8			520 270			
205	115	Remote	10	3.0		150 to 66 to 375 190				
207	115	Remote	15	4.5	370					
209	115	Remote	20	6.0						

Step 2: Select Housing

12N6-B45-U8-C2A-JJTTNQ

Replace N6 in the sample model number with the appropriate housing designator.

Housing (Designator 2)	Specifications
RT	33 mega rad See figures 4 and 5 (page 3) for DBE profile. Material: 316SS (CF8M)
N6	33 mega rad See figures 4 and 5 (page 3) for DBE profile. Material: carbon steel
TA	200 mega rad See figure 3 (page 2) for DBE profile. Material: ductile iron. Temperature switches in the TA housing are qualified for 33 M rad and HELB only.

Step 3: Select Switching Element

12N6-B45-U8-C2A-JJTTNQ

Replace B in the sample model number with the appropriate switching element designator.

Switch (Designator 3)	AC Rating		DC Rating Resistive		Contact Form	
(Designator 3)	Volts	Amps	Volts	Amps		
В	250	5	125	0.3	SPDT	
Υ*	250	5	•	-	SPDT	
W*	250	5	-	-	SPDT	
BB	250	5	125	0.3	DPDT	

^{*}DC rating is optional. Contact SOR.

Step 4: Select Diaphragm System

Replace U8 in the sample model number with the appropriate diaphragm system designator.

12N6-B45-**U8**-C2A-JJTTNQ

NOTE: If the designator 1 (chosen in step 1) does not appear under Compatible Designators, the line item is not available.

Diaphragm	Diaphragm Material	Diaphragi	n System	Compatible Designators	
(Designator 5)		Welded	O-Ring	(Designator 1)	
U8		Yes	None	12, 4, 5, 6***	
M4*		No	Viton	54	
M9	316SS	No	EPR	54	
U9*		Yes	None	201, 203, 205, 207, 209	
U1**		Yes	None	9, 29****	

- * M4 and U9 diaphragm systems are qualified for 33 M rad and HELB only.
- ** Reduced drift and dead band. Affects qualification levels. Consult SOR.
- *** Designators 9 and 29 are also available. Consult SOR.
- **** Designators 5 and 6 are also available. Consult SOR.

Step 5: Select Process Connection

Replace C2A in the sample model number with the appropriate process connection designator.

12N6-B45-U8-C2A-JJTTNQ

NOTE: If the designator 1 (chosen in step 1) does not appear under Compatible Designators, the line item is not available.

Process Connection (Designator 6)	Connection Material	Connection Size/Type		Compatible Designators (Designator 1)
C1A		1/4	NPT(F)	10 4 5 6 0 00 54
C2A	316SS	1/2	NPT(F)	12, 4, 5, 6, 9, 29, 54
C7A		1/2	NPT(M)	201, 203, 205, 207, 209

Step 6: Select Accessories

12N6-B45-U8-C2A-JJTTNQ

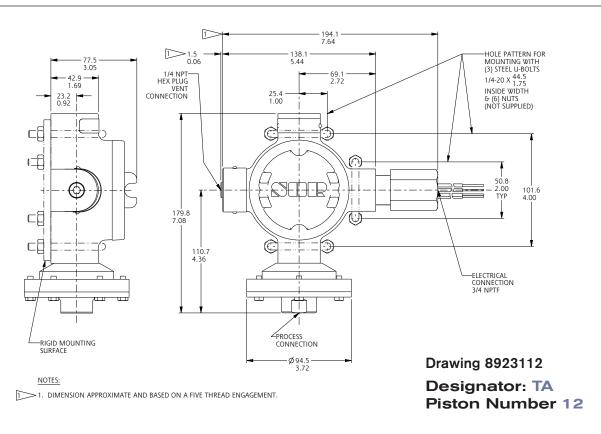

Accessories (Designator 7)	Description
וו	Conduit seal with 17 ft. lead wire length. Optional. This designator must be used for HELB and LOCA applications.
RR	Stainless steel tag attached with stainless steel wire to housing.
TT	Oversized nameplate for tagging information. Required designator.
NQ	Nuclear-qualified model. Required designator.

Approximate Weights

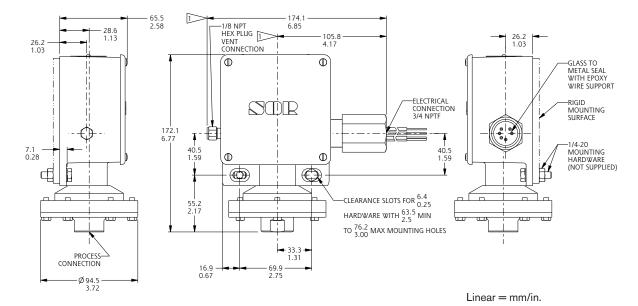

Designator	Piston	Weight (lbs)	Kilograms
	No. 12	8.81	4.00
TA	No. 4, 54	7.19	3.26
	No. 5, 6, 9, 29	6.75	3.06
	No. 12	7.13	3.23
RT	No. 4, 54	5.50	2.49
	No. 5, 6, 9, 29	5.06	2.30
	No. 12	5.63	2.55
N6	No. 4, 54	3.94	1.79
	No. 5, 6, 9, 29	3.56	1.62

Includes weight of "JJ" conduit seal. Excludes weight of external wire leads.
